Synthetic Presentation Rehearsal

This document tests a shared manuscript layout and a bounded figure repair loop. All curves, surfaces and trajectories are synthetic demonstrations. They do not describe a real competition solution, field observation or approved result. The comparison uses identical source figures before and after a single width edit. The original manuscript and project registries must remain unchanged.

Keywords: synthetic example; scientific figures; reproducible layout.

1 Layout and Figure Verification

This short synthetic specimen tests the shared font and layout defaults. It is not a complete modeling paper. Figure 1 starts wider than the text column to exercise a bounded repair. The plotted values must remain unchanged.

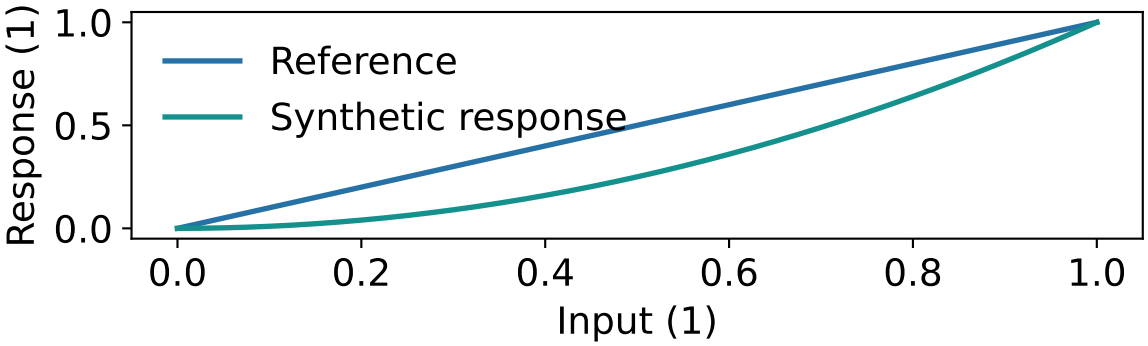

Figure 1: Fixed synthetic curves. The axes use dimensionless units.

1.1 Three dimensions with direct readout

Figure 2 combines a response surface with the same grid in plan view. Figure 3 uses true spatial coordinates with XY and XZ projections. Their data, units, color ranges and source hashes are fixed. Neither demonstration establishes a real mechanism or an optimal decision.

1.2 Checks and interpretation

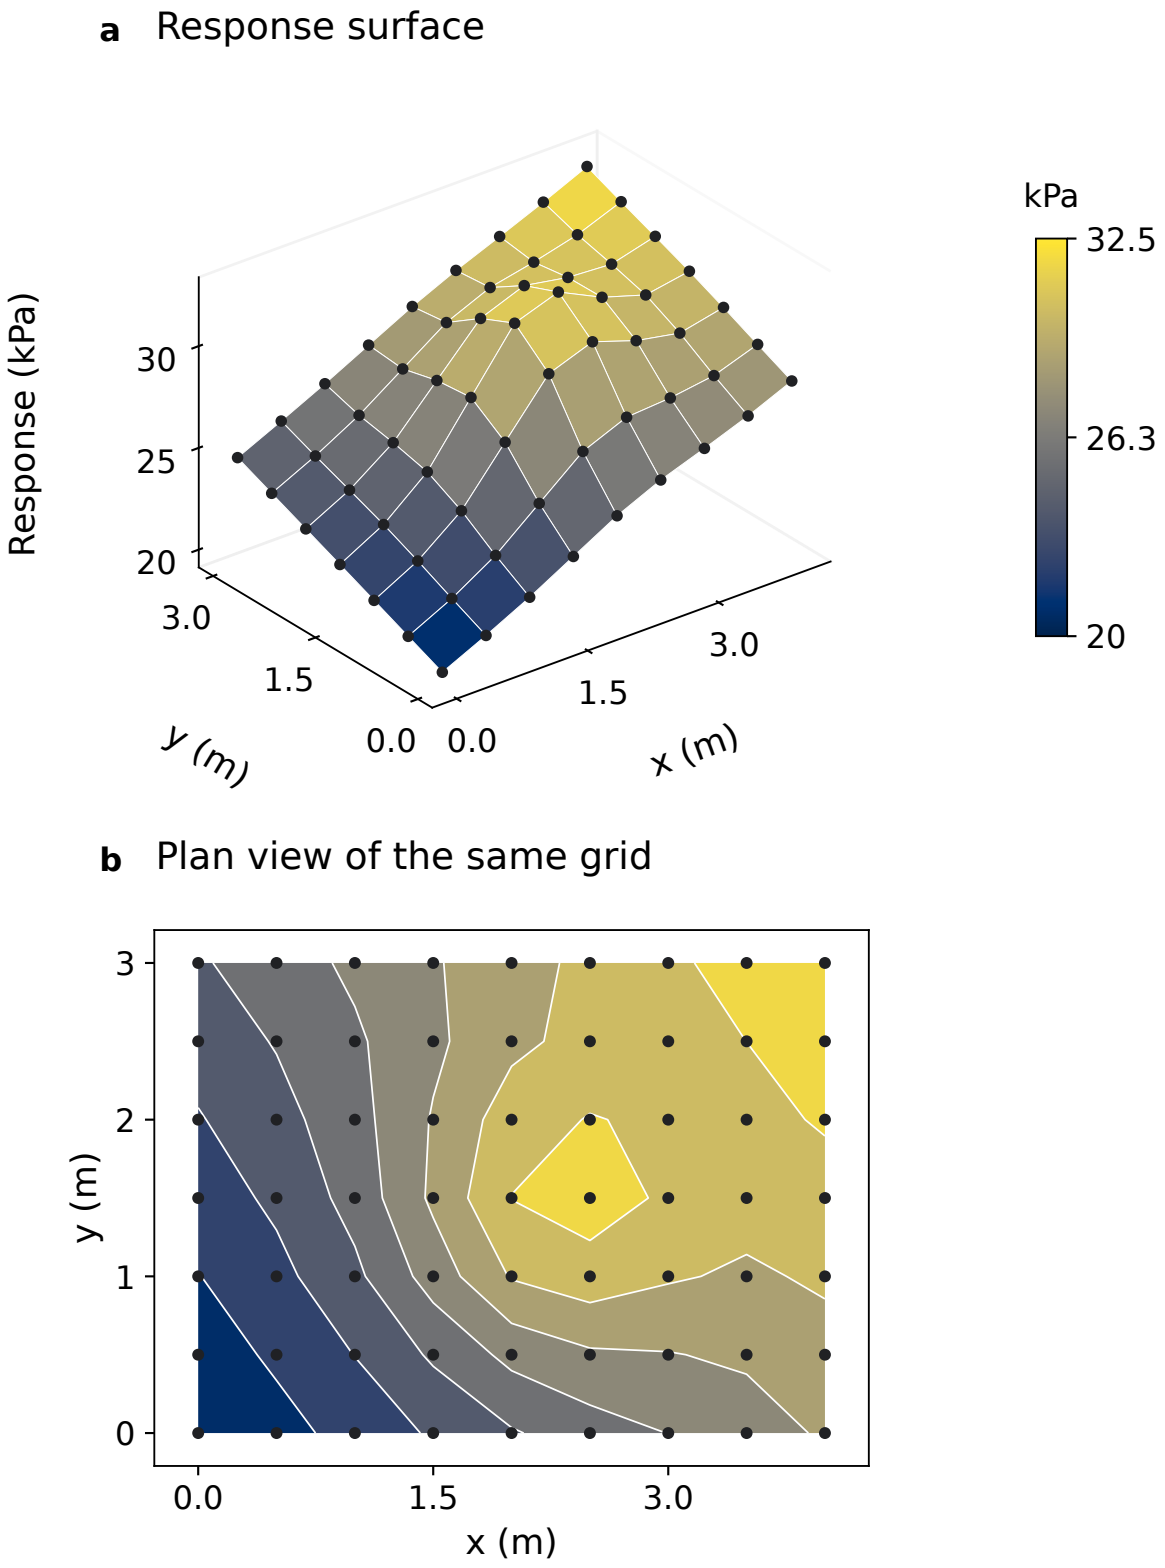

Compilation, pixel-complete page rendering and font checks are separate from visual acceptance. A source-label crop and an interior blank area were found in an earlier specimen and corrected before this version. The repair loop changes only a supported insertion width; complex layouts remain review tasks.

Report on Use of AI Tools

Codex generated the specimen and plotting code. Fixed-version build, fault and non-author review records describe their actual scope; no user approval is implied.
